## Question: 1

Refer to the exhibit.

The screenshot shows the 'Query Save Set' window in Dell EMC NetWorker. It displays a table with 11 items. The 'Clone Flags' column is highlighted with a red box, showing a 'T' flag for the first save set. The table has the following columns: Policy, Clone Flags, Workflow, Action, and Client.

Policy	Clone Flags	Workflow	Action	Client
Silver	T	Filesystem Cloud Tier	clone	win-client
Server P...		Server backup	Server d...	nw.dellemc.e...
Server P...		Server backup	Server d...	nw.dellemc.e...
Server P...		Server backup	Server d...	nw.dellemc.e...

An administrator asks about the clone flag on the Cloud. What does the T flag represent?

- A. Save set exists only on a Cloud Tier device
- B. Save set will be cloned to a tape device
- C. Save set will be terminated at the cloud provider
- D. Save set exists only on the cloud storage

**Answer: B**

Explanation:

The T flag on the Cloud in Dell EMC NetWorker represents that the save set will be cloned to a tape device. This allows for the save set to be stored on the tape device in addition to the cloud storage, providing additional backup and redundancy.

## Question: 2

Which command can be used to query the NetWorker media database and to export the fields as comma separated fields?

- A. mminfo -avot
- B. mminfo -xc,
- C. mminfo -csv
- D. mminfo -m

**Answer: A**

Explanation:

The mminfo command can be used to query the NetWorker media database and to export the fields as comma separated fields. The -avot flag will list all volumes and export the fields as a comma separated list.

### Question: 3

A customer recently added a Hyper-V 2016 servers' farm, and the hosted Virtual Machines need to be backed up. The administrator has already installed a NetWorker client on all Hyper-V hosts. Which additional component must be installed on the Hyper-V hosts to accomplish this task?

- A. Storage Node
- B. NMDA
- C. NMM
- D. vProxy

**Answer: B**

Explanation:

NMDA, or NetWorker Module for Databases and Applications, must be installed on the Hyper-V hosts in order to back up the hosted Virtual Machines. NMDA is a specialized NetWorker client that provides support for databases and applications such as Microsoft Exchange, Hyper-V, and Oracle.

### Question: 4

---

A backup administrator is deploying an extended client on a Linux host. The following error is observed during the installation:

Cannot contact a portmapper on port 7937

What is the recommended action to resolve this issue?

- A. Install the lgtocInt-[version].rpm package and reinstall the Extended client.
- B. Install the lgtoserv-[version] rpm package and reinstall the Extended client.
- C. Install the lgtonode-[version].rpm package and reinstall the Extended client.
- D. Install the Lgtobbb-[version].rpm package and reinstall the Extendd client

**Answer: B**

Explanation:

The error "Cannot contact a portmapper on port 7937" indicates that the portmapper service, which is required for the NetWorker Extended Client installation, is not running on the Linux host. The recommended action to resolve this issue is to install the lgtoserv-[version] rpm package and reinstall the

Extended client. The other options are not related to this process.

## Question: 5

A backup administrator has configured Dell EMC Cloud Tier and the NetWorker data movement policy for long-term retention. The save sets are not moved to the Cloud even though cloning ran successfully. What is the reason for this issue?

- A. Data movement policy on PowerProtect DD was not running yet
- B. User does not have the Cloud Tier privilege
- C. Data movement will occur only one time per month
- D. Missing replication license on PowerProtect DD

**Answer: C**

Explanation:

The data movement policy on Dell EMC Cloud Tier is configured to move the save sets to the Cloud only once a month. The cloning of the save sets may have run successfully, but the data movement will still only occur once a month.
